模锻滑架

Forging Trolley

滑架的作用是承受物件，吊具及链条的重量，在垂直弯曲段还要承受链条张紧的合力，并能保证链条按轴道的线路运行。在线路中两个负载滑架之间距离超过800-900时，可在中间增加一个空载滑架。

The sliding frame is used to bear weight of objects, hoisting tool and chain and its vertical curved section shall also bear resultant force of tensioned chains and ensure running of chain along the channel of the shaft. In case the distance between two load sliding frames is over 800-900mm, a free-load sliding frame can be added.
